Tol556
Ca2+-transporting ATPase (EC 3.6.3.8) ECA2 [imported] - Arabidopsis thaliana
N;Alternate names: Ca2+-ATPase
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 19-Feb-1999 #sequence_revision 19-Feb-1999 #text_change 19-Apr-2002
C;Accession: Tol556; T52582
C;Accession: Tol556; T52582
R;Dempsey, S.; Harper, M.
Submitted to the EMBL Data Library, July 1997
A;Description: The sequence of A. thaliana TM018A10.
A;Reference number: Z14348
A;Reference number: Z14348
A;Reference contact translated from GB/EMBL/DDBJ
A;Accession: Tol556
A;Status: translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Reference: EMBL:AF013294; NID:92252848; PIDN:AAB62850.1; PID:92252852; GSPDB:GN

TISSUE SPECIFICITY: Strongly expressed in liver and fetal liver.
Expressed to a much lesser extend in traverse colon, lymph nodes, heart, thymus, pancreas, descending colon, stomach and testis.
SIMILARITY: Belongs to the N-acetylmuramoyl-L-alanine amidase
                                                                                                                                                                                                                                                                                                                                                                                                                      CARBOHYDRATE-LINKAGE SITE ASN-485.

(**SOFORMS A AND B).

Sang Y., Roef C.R., Blecka F.;

"Characterization of porche peptidoglycan recognition proteins: gene
"Coning and regulation on huate immunity.";

Submitted (AUG-2002) to the EMBL/GenBank/DDBJ databases.

-!- FURCTION: May plays a scavenger role by digesting biologically
active peptidoglycan (FGN) into biologically inactive fragments.

Has no direct bacter/olytic activity.

-!- CATALYTIC RETIVET: Hydrolyzes the link between N-acetylmuramoyl
residues and L-amino acid residues in certain bacterial cell-wall
                                                                                                                                                                                                                                Gaps
                                (in isoform 2).

Assample and SH3 domain Ese proteins regulate endocytosis by linking to dynamin and Eps15.";

EMBO J. 18:1159-117(1199).

LEMO J. 18:1159-117(1199).

LEMO J. 18:1159-117(1199).

May regulate the formation of clathrin-coated vesicles.

LEMO J. SUBUNIT: Belongs to a complex that may contain multimers of ITSN1, ITSN2 and Eps15, and different partners according to the step in TSN2 and Eps15, and different partners according to the step in STENIAR LOCATION: Cytoplasmic (By similarity).

C. I. SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- TISSUE SPECIFICITY: Widely expressed in adult tissues.

-!- TISSUE SPECIFICITY: Widely expressed in adult tissues.

-!- DEVELOPMENTAL STAGE: Widely distributed throughout the adult forebrain. Prominent expression was observed in the nadoctoc.

-!- DEVELOPMENTAL STAGE: Widely distributed throughout the adult forebrain. The angold of the pyramidal cell layers of hippocampus, the piritorm cortex, the pyramidal cell layers of hippocampus, the dentate gyrus, in several nuclei of the thalamus and hypothalamus and in the amgradala.

-!- SIMILARITY: Contains 1 EF-hand calcium-binding domain.

-!- SIMILARITY: Contains 2 EH domains.

-!- SIMILARITY: Contains 1 PH domain.

-!- SIMILARITY: Contains 5 EH domains.

-! FUNCTION: EBSENLIAL for protein export.

-! FUNCTION: EBSENLIAL for protein export.

-! GUBUIT: PART OF THE PROKANYOTIC PROTEIN TRANSLOCATION APPARATUS

WHICH COMPRISE SECA, SECB, SECB, SECB, SECF, SECG AND SECY. THE

TRANSLOCATION CHANNEL SEEMS TO BE COMPSOED OF A SECA HOMODIMER AND

FOUR COPIES OF A SECYEG COMPLEX.

-! SIBCELLUIAR LOCATION: Integral membrane protein. Inner membrane.

-! SIBCELLUIAR LOCATION: Integral membrane family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Bacteriol. 185:2330-2337(2003).

-i. FUNCTION: BSsential for protein export (By similarity).

-i. SUBUNIT: PART OF THE PROKARYOTIC PROTEIN TRANSLOCATION APPARATUS
WHICH COMPRISE SECA, SECB, SECD, SECE, SECF, SECF AND SECY. THE
TRANSLOCATION CHANNEL SEEMS TO BE COMPROSED OF A SECA HOMODIMER AND
FOUR COPIES OF A SECXEG COMPLEX (By similarity).

-i. SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SPECIES=S. 179hi; STRAIN=CT18; MEDLINE=21534947; PubMed=11677608; MEDLINE=21534947; PubMed=11677608; MEDLINE=21534947; PubMed=11677608; Churcher C., Mungall K.L., Bentley S.D., Holden M.T.G., Sebahhia M., Baker S., Basham D., Brocks K., Chillingworth T., Connerton P., Cronin A., Davis P., Davies R.M., Dowd L., White N., Farrar J., Cronin A., Larsen P., Haque A., Hien T.T., Holroyd S., Jagels K., Krogh A., Larsen T.S., Leather S., Woule S., O'Gaora P., Parry C., Quail M.A., Rutherford K., Simmonds M., Skelton J., Stevens K., Whitehead S., Barrell B.G.;

Bacteriol. 177:4121-4126 (1995).
-!- FUNCTION. May be required for the biogenesis of c-type cytochromes. Possible subunit of a heme lyase.
-!- SUBCELLULAR LOCATION: Periplasmic (Probable).
-!- SIMILARITY: BELONGS TO THE CCMH/CYCL/CCL2/NRFF FAMILY.

    rotation.
    SUBUNIT: The basal body constitutes a major portion of the flagellar organelle and consists of four rings (L, P, S, and mounted on a central rod (By similarity).
    SUBCELLUIAR LOCATION: Periplasmic (By similarity).
    SIMILARITY: Belongs to the flg1 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ,

CATALYTIC ACTIVITY: 2-deoxy-D-ribose 1-phosphate = 2-deoxy-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nature 390:249-256(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ribose 5-phosphate.
COFACTOR: Binds I or 2 manganese ions (Potential).
PATHWAY: Nucleotide and deoxyribonucleotide catabolism.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- SIMILARITY: Belongs to the phosphopentomutase family.
Bacillus subtilis.
Bacteria; Firmicutes; Bacillales; Bacillaceae, Bacillus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=98044033; PubMed=9384377;
